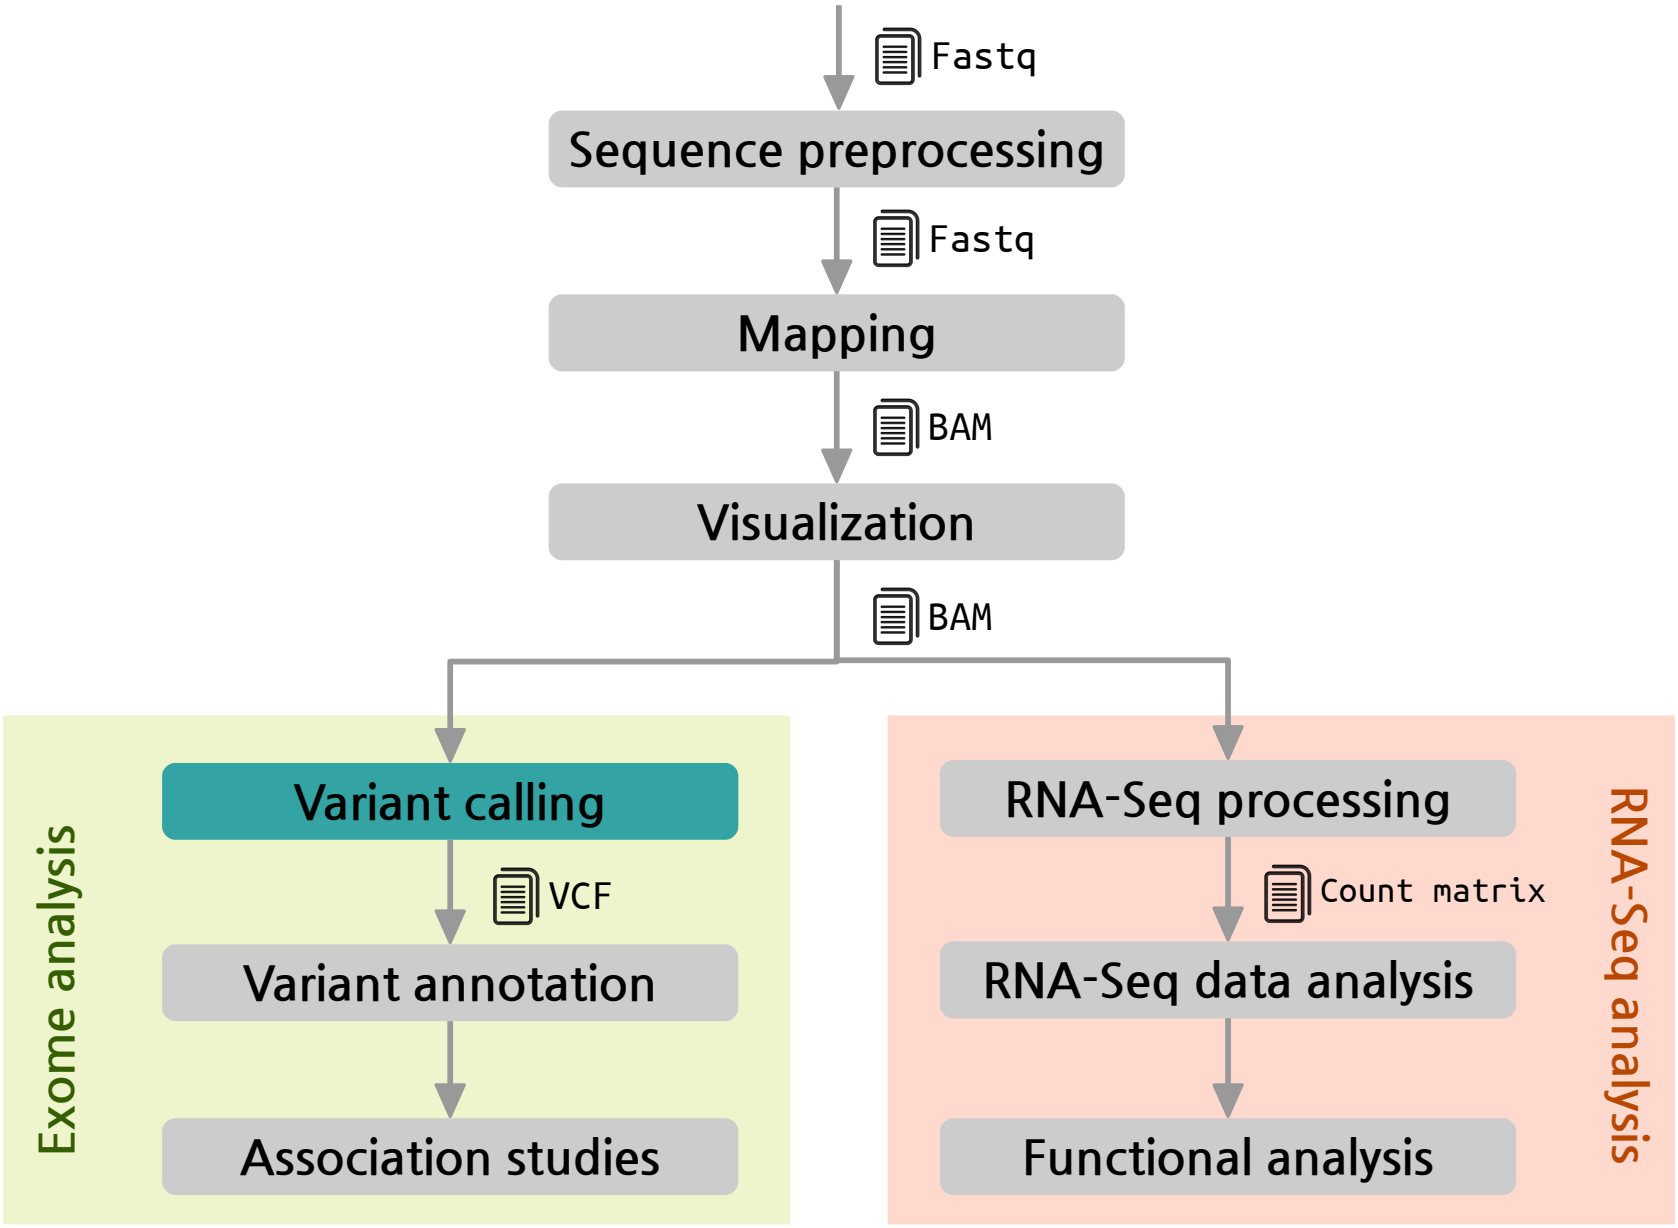
The pipeline



Genomic variation
Terminology

- **Variant**: sequence data difference that exists between individuals in a population
- **Mutation**: molecular event that created a variant
- **Allele**: forms of the bases occupying the same position on matching chromosomes
- **Genotype**: allelic state in a specific individual
  - AA homozygous or AT heterozygous at specific base
- **Polymorphism**: sequence variation that is common within a population
  - "SNP on chromosome 16 associated with obesity"

Types of Genome Sequence Variants

1. **Single Nucleotide Variants (SNVs)**

   Single base changes, e.g., A→T.

2. **Insertions-Deletions (Indels)**

   Consisting of one or a few bases, e.g., +ATGA, ΔT.

3. **Structural Variants (SVs)**

   Everything else: large deletions, insertions, duplications, inversions, translocations, mobile element insertions, horizontal gene transfer

Objective

Scenario

- Some variation observed in BAM files is caused by mapping and sequencing artifacts

Objective

- Separate **true variation** from machine artifacts

- Balance between:
  - **Sensitivity:** minimize false negatives (i.e.: failing to identify real variants)
  - **Specificity:** minimize false positives (i.e.: failing to reject artifacts)

Variant calling process pipeline

1. **Mark duplicates**

   Duplicates should not be counted as additional evidence

2. **Local realignment around INDELS**

   Reads mapping on the edges of INDELS often get mapped with mismatching bases introducing false positives

3. **Base quality score recalibration (BQSR)**

   Quality scores provided by sequencing machines are generally inaccurate and biased

4. **Variant calling**

   Discover variants and their genotypes

1. Mark duplicates

- All NGS **sequencing platforms are NOT single molecule sequencing** → the same DNA molecule can be sequenced several times
- **PCR** → duplicate DNA fragments in the final library
- If there is a base variation it will have **high depth support**
- Can result in **false variant calls**

Tools

- **Samtools**: `samtools rmdup` or `samtools rmdupse`
- **Picard/GATK**: MarkDuplicates

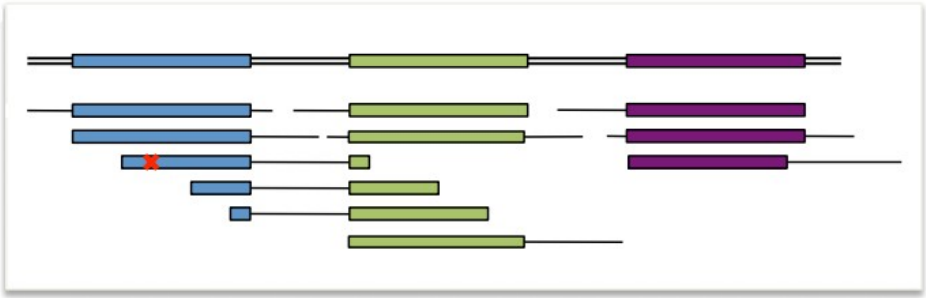
1. Mark duplicates

The reason why duplicates are bad

✖ = sequencing error propagated in duplicates

FP variant call (bad)

After marking duplicates, the GATK will only see :

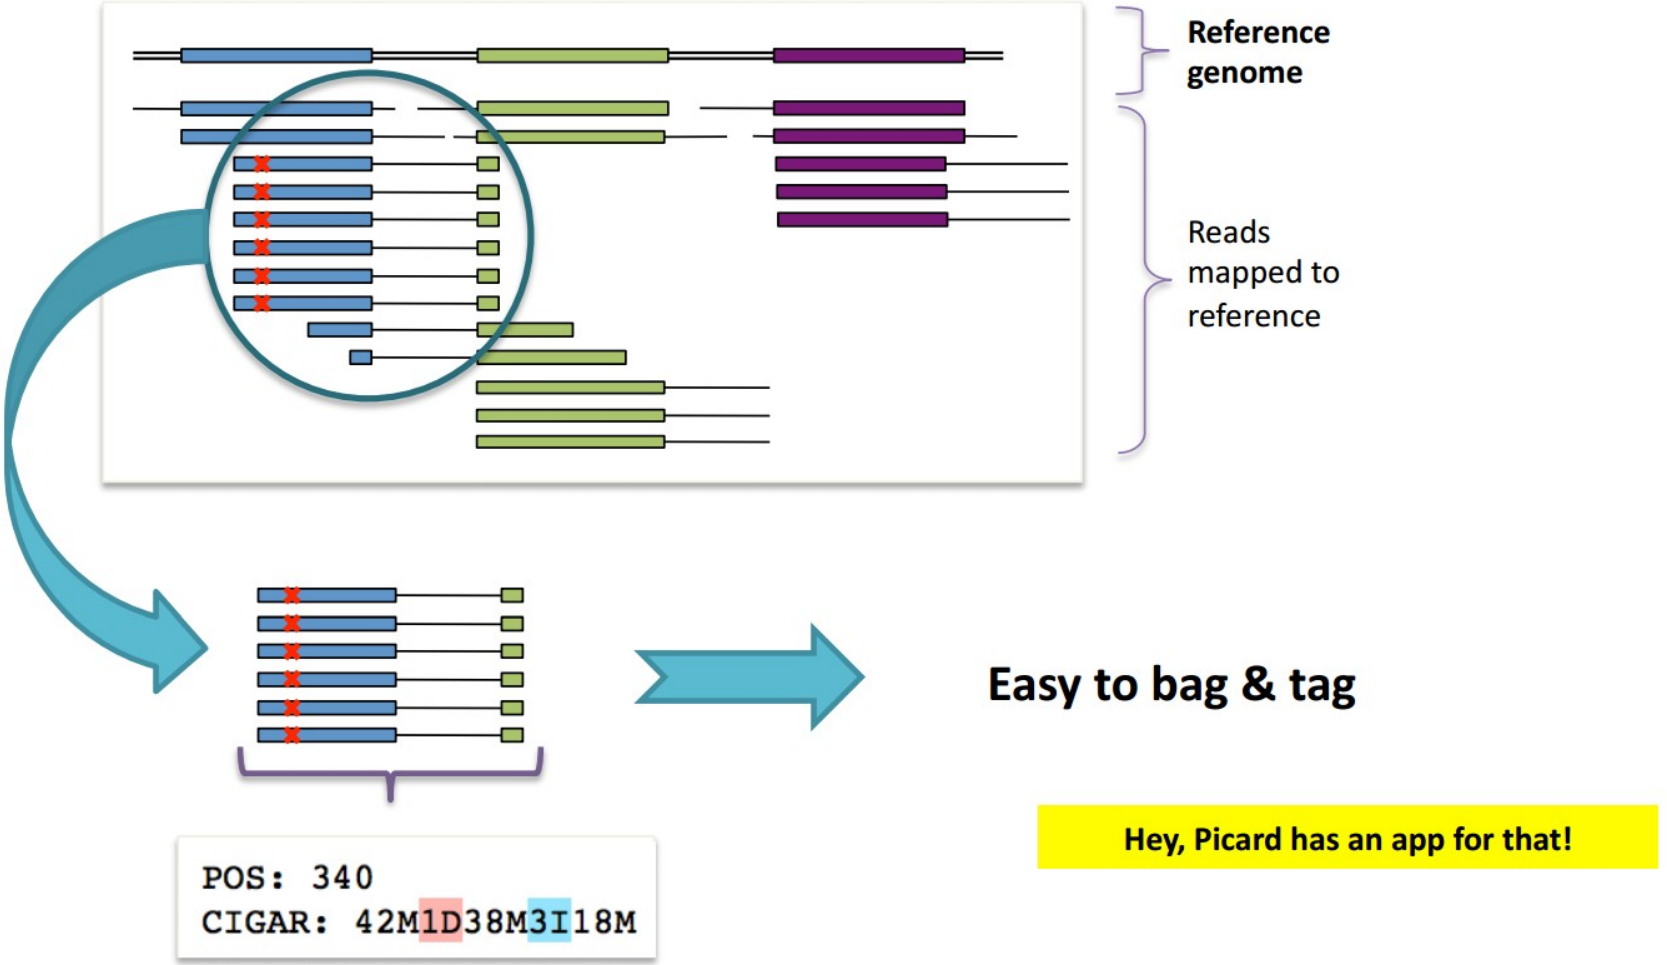


… and thus be more likely to make the right call

1. Mark duplicates

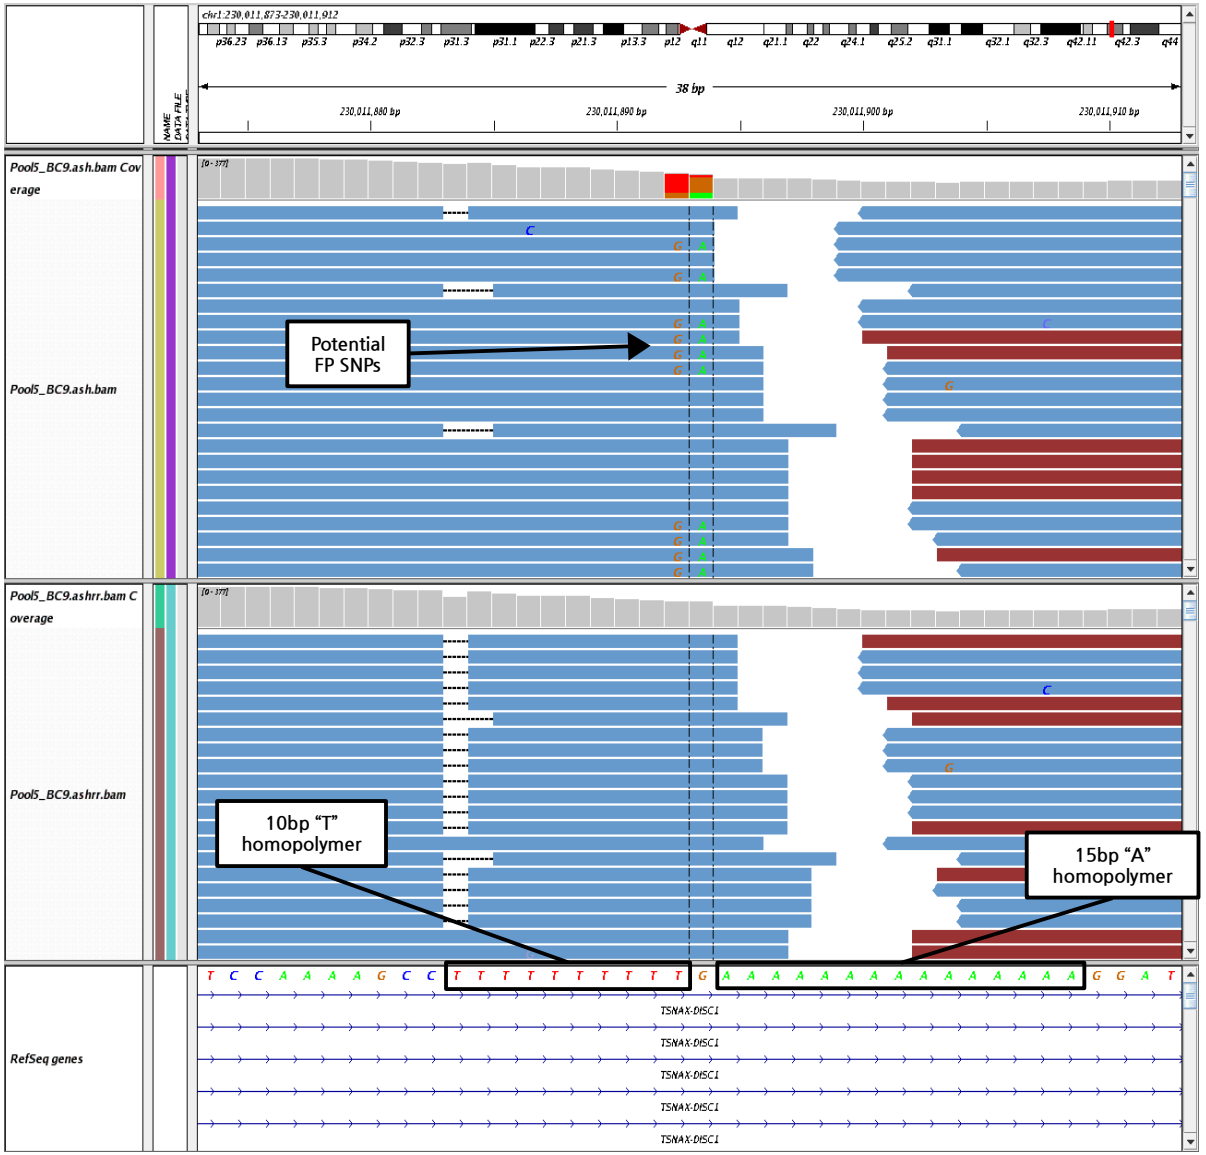
Duplicate identification

Duplicates have the same starting position and the same CIGAR string



2. Local realignment around INDELS

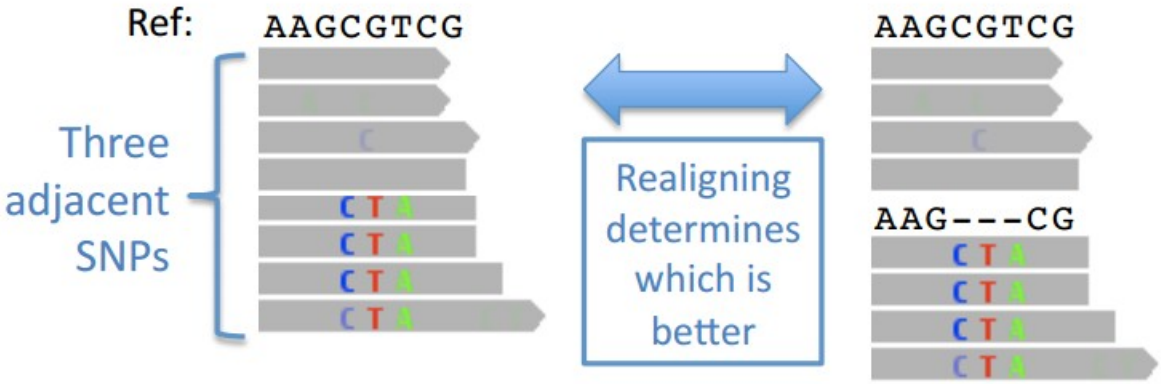
- Alignment algorithms tend to produce some **artifacts**
- Reads **near INDELS** are mapped with mismatches
- **Realignment** can identify the most consistent placement for these reads
  1. **Identify** problematic regions
  2. **Determine the optimal** consensus sequence
- **Minimizes mismatches** with the reference sequence
- **Refines** location of **INDELS**



DePristo MA, et al. A framework for variation discovery and genotyping using next-generation DNA sequencing data. Nat Genet. 2011 May;43(5):491-8. PMID: 21478889

2. Local realignment around INDELS

- Alignment algorithms tend to produce some **artifacts**
- Reads **near INDELS** are mapped with mismatches
- **Realignment** can identify the most consistent placement for these reads
  1. **Identify** problematic regions
  2. **Determine the optimal** consensus sequence
- **Minimizes mismatches** with the reference sequence
- **Refines** location of **INDELS**



DePristo MA, et al. A framework for variation discovery and genotyping using next-generation DNA sequencing data. Nat Genet. 2011 May;43(5):491-8. PMID: 21478889

3. Base quality score recalibration

- **Calling algorithms rely** heavily on the **quality scores** assigned to the individual base calls in each sequence read
- Unfortunately, the scores produced by the machines are subject to various sources of **systematic error**, leading to over- or under-estimated base quality scores in the data

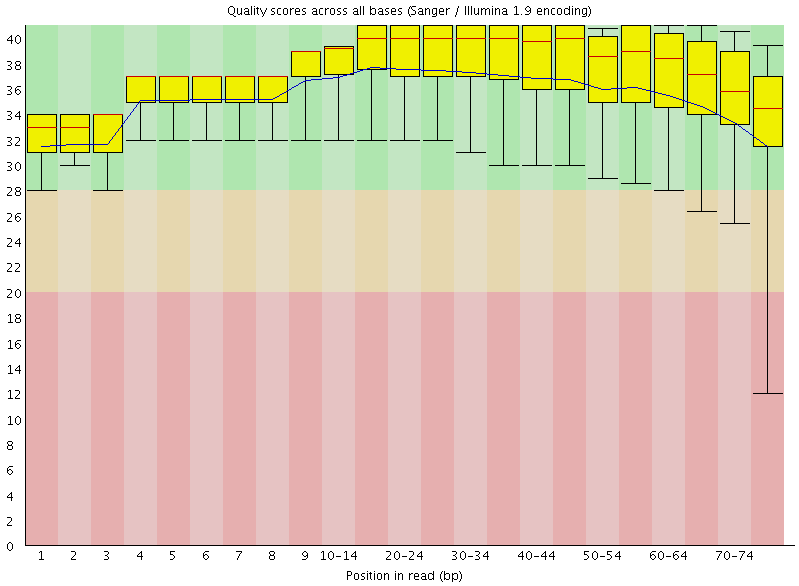
How?

1. **Analyse covariation** among several features of a base:
   - Reported quality score
   - Position within the read
   - Preceding and current nucleotide
2. Use a set of **known variants** (i.e.: dbSNP) to model error properties of real polymorphism and determine the **probability that novel sites are real**
3. **Adjust** the quality scores of all reads in a BAM file

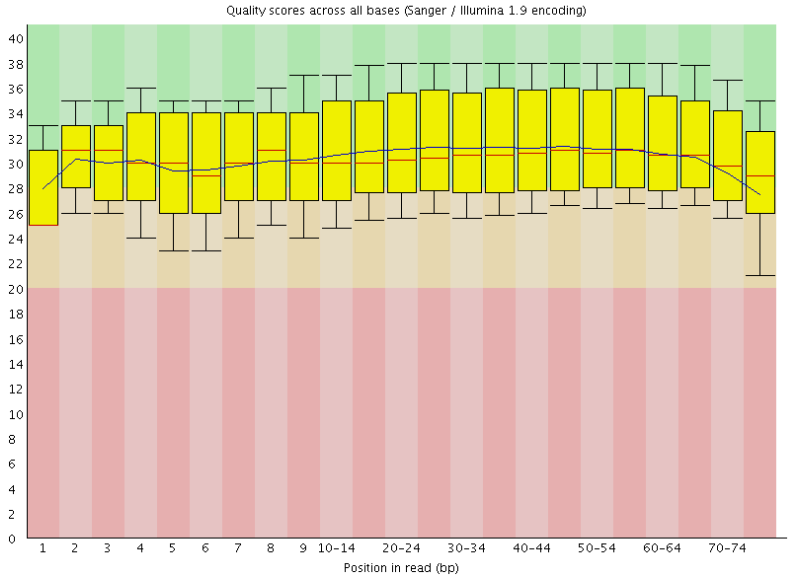
- Requires a reference genome and a catalog of known variable sites.

3. Base quality score recalibration

Before



After



Phred Quality score:

$$Q_{\text{Phred}} = -10 \log_{10} P(\text{error}).$$

A score of 20 corresponds to 1% error rate in base calling

4. Variant calling

Variant discovery process

Steps

1. **Variant calling:** Identify the positions that differ from the reference
2. **Genotype calling**: calculate the genotypes for each sample at these sites

Initial approach

Independent base assumption

Counting the number of times each allele is observed

Evolved approach

Bayesian inference → Compute genotype likelihood

Advantages:

Provide statistical measure of **uncertainty**

Lead to **higher accuracy** of genotype calling

4. Variant calling

Two different methods

UnifiedGenotyper

Call **SNPs and indels separately** by considering each variant locus independently

Accepts any ploidy

Pooled calling

High sample numbers

HaplotypeCaller

Call SNPs, indels, and some SVs simultaneously by performing a local de-novo assembly

More accurate, especially for indels

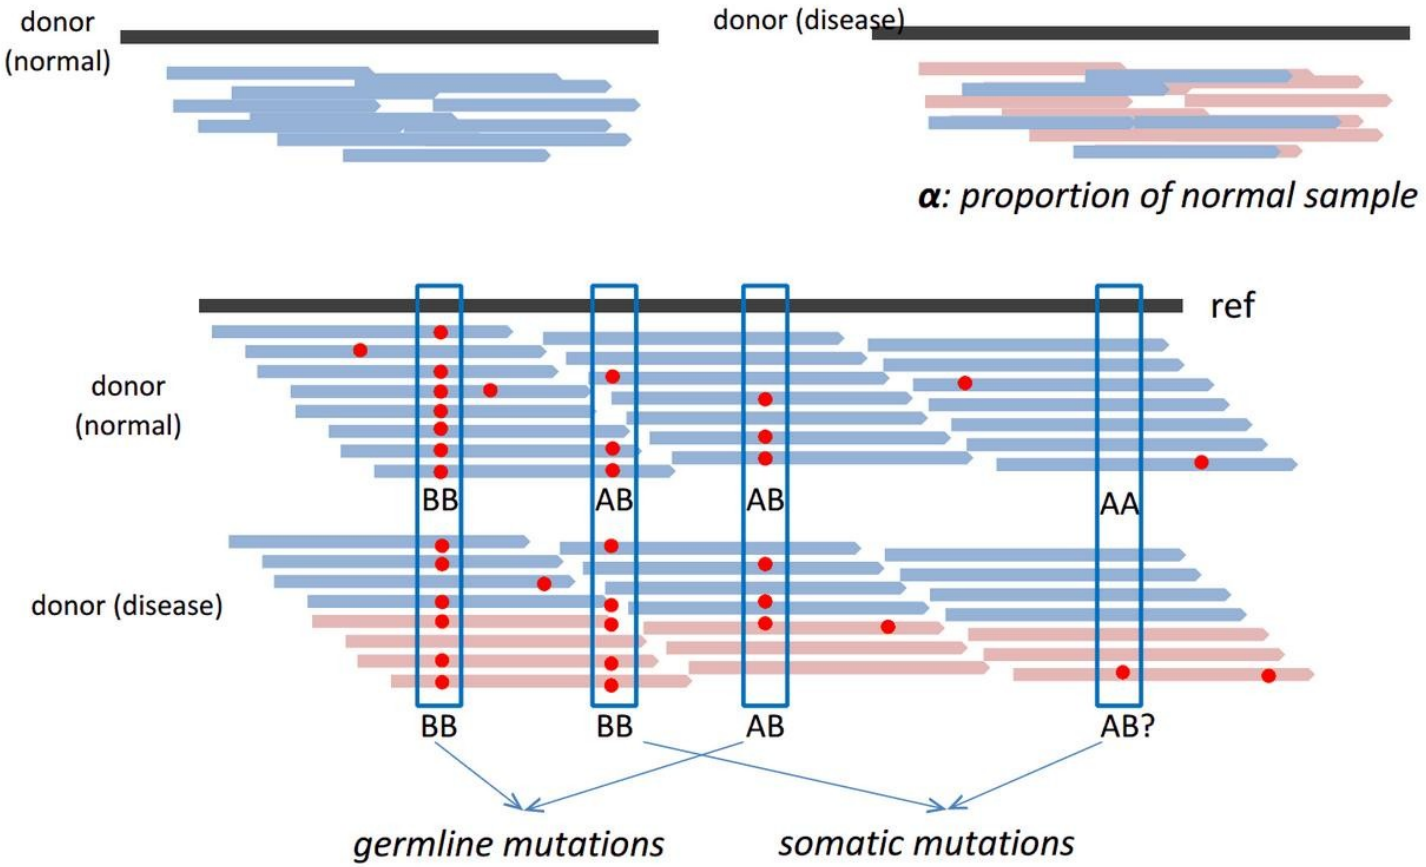
Will eventually replace UG

Somatic calling

Detenting somatic SNVs in cancer

Challenges:

- Somatic variants occur at low frequency in genome
- Most tumors are impure and heterogeneous



VCF file format

- Specification defined by the 1000 genomes (current version **4.2**):
  http://www.1000genomes.org/wiki/Analysis/Variant%20Call%20Format/vcf-variant-call-format-version-41
- Commonly **compressed and indexed** with bgzip/tabix
- Single-sample or multi-sample VCF

- **CHROM**: chromosome
- **POS**: position
- **ID**: identifier
- **REF**: reference base(s)
- **ALT**: non-reference allele(s)
- **QUAL**: quality score of the calls (phed scale)
- **FILTER**: “PASS” or a filtering tag
- **INFO**: additional information
- **FORMAT**: describes the information given by sample

Software

Software	Available from	Calling method	Prerequisites	Comments	Refs
SOAP2	http://soap.genomics.org.cn/index.html	Single-sample	High-quality variant database (for example, dbSNP)	Package for NGS data analysis, which includes a single individual genotype caller (SOAPsnp)	15
realSFS	http://128.32.118.212/thorfinn/realSFS/	Single-sample	Aligned reads	Software for SNP and genotype calling using single individuals and allele frequencies. Site frequency spectrum (SFS) estimation	-
Samtools	http://samtools.sourceforge.net/	Multi-sample	Aligned reads	Package for manipulation of NGS alignments, which includes a computation of genotype likelihoods (samtools) and SNP and genotype calling (bcftools)	53
GATK	http://www.broadinstitute.org/gsa/wiki/index.php/The_Genome_Analysis_Toolkit	Multi-sample	Aligned reads	Package for aligned NGS data analysis, which includes a SNP and genotype caller (Unifed Genotyper). SNP filtering (Variant Filtration) and SNP quality recalibration (Variant Recalibrator)	32,33
Beagle	http://faculty.washington.edu/browning/beagle/beagle.html	Multi-sample LD	Candidate SNPs, genotype likelihoods	Software for imputation, phasing and association that includes a mode for genotype calling	42
IMPUTE2	http://mathgen.stats.ox.ac.uk/impute/impute_v2.html	Multi-sample LD	Candidate SNPs, genotype likelihoods	Software for imputation and phasing, including a mode for genotype calling. Requires fine-scale linkage map	44
QCall	ftp://ftp.sanger.ac.uk/pub/rd/QCALL	Multi-sample LD	'Feasible' genealogies at a dense set of loci, genotype likelihoods	Software for SNP and genotype calling, including a method for generating candidate SNPs without LD information (NLDA) and a method for incorporating LD information (LDA). The 'feasible' genealogies can be generated using Margarita (http://www.sanger.ac.uk/resources/software/margarita)	54
MaCH	http://genome.sph.umich.edu/wiki/Thunder	Multi-sample LD	Genotype likelihoods	Software for SNP and genotype calling, including a method (GPT_Freq) for generating candidate SNPs without LD information and a method (thunder_glf_freq) for incorporating LD information	-

A more complete list is available from http://seqanswers.com/wiki/Software/list. LD, linkage disequilibrium; NGS, next-generation sequencing.

GATK (Genome Analysis ToolKit)

http://www.broadinstitute.org/gatk/

- Probabilistic method: **Bayesian estimation** of the most likely genotype
- Calculates many **parameters** for each position of the genome
- INDEL realignment
- Base quality recalibration
- SNP and INDEL calling
- **Multi-sample** calling
- Uses standard input and output files
- Used in **many NGS projects**, including the 1000 Genomes Project, The Cancer Genome Atlas, etc.

GATK prerequisites

- **Requires Java** (http://www.oracle.com/technetwork/java/javase/downloads/index.html)
  - Check your java version

```
java -version
```

GATK ≥ 2.6 → Requires Java version 1.7

- **Picard**
  - Website: http://picard.sourceforge.net/
  - Go to Download page and select

Download picard-tools-1.108.zip (47.0 MB)

  - Testing:

```
java -jar AddOrReplaceReadGroups.jar -h
```

  - Usage

```
java -jar <ToolName> [options]
```

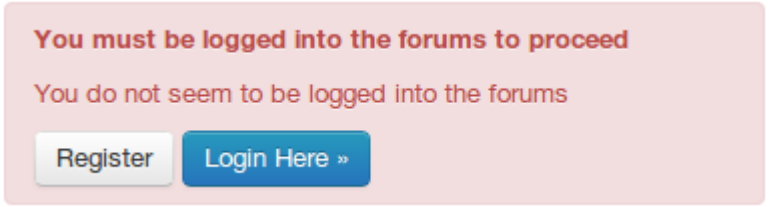
GATK installation

- **GATK 2.8 download**

  http://www.broadinstitute.org/gatk/

  - We need to register before download
  - Go to Downloads and click 

  - Accept the license agreement
  - Extract the file in the applications folder



- **Check if GATK is working**

Show GATK help

```
java -jar GenomeAnalysisTK.jar -h
```

- **Usage**

```
java -jar GenomeAnalysisTK.jar -T <ToolName> [arguments]
```

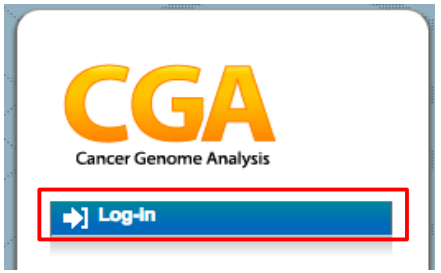
MuTect installation

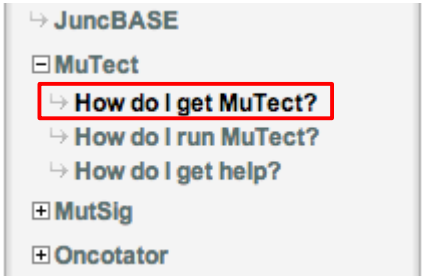
- **MuTect download**

  http://www.broadinstitute.org/cancer/cga/mutect

  - Click ***Log-in*** and go to the ***Create new account*** tab
  - Fill the form
  - Go to ***How do I get mutect*** and accept the license agreement
  - Download the latest version

    muTect-1.1.4-bin.zip
  - Extract the file in the applications folder





- **Check if MuTect is working**

```
java -jar muTect-1.1.4.jar -h
```

- **Usage**

```
java -jar muTect-1.1.4.jar --analysis_type MuTect [arguments]
```

THANK YOU.
